

EduWand Platform (Feature List)

Enrolment Growth Engine and AI Module, Eight Week Build Scope

1. Overview

This document lists, in full detail, every feature being built across the two modules in scope for the eight week build: the Enrolment Growth Engine and the AI Module. For each module it sets out the purpose, the complete feature list, who uses it, and the testable conditions that confirm a feature is working as intended.

Module	Purpose	Primary User
Enrolment Growth Engine	Captures every prospective-student enquiry and automates admissions follow up	Front desk staff, admissions counsellors, leadership
AI Module, Lesson Studio and Assignment Lab	Lets teachers plan lessons and create, personalise, and grade assignments with AI support	Teachers

2. Module 1, Enrolment Growth Engine

Schools already run a basic ERP, but enquiries leak and are not systematically converted. This engine captures every prospective-student enquiry from any channel as a structured record, then runs automated multi-channel follow up to convert enquiries into admissions. It is built to run standalone, alongside a school's existing ERP, with no dependency on any other EduWand module.

2.1 Full Feature List

Enquiry Capture

- Omni-channel enquiry capture: phone call, walk-in, website form, referral, expo or event, social media
- Structured enquiry record: contact details, source, grade or board interest, status, owner, timestamps, notes
- Public website enquiry form, embeddable on the school's own site
- Bulk upload for enquiries collected at events or expos

Admissions Pipeline

- Configurable pipeline with stages: New, Contacted, Visit, Application, Admitted, Enrolled, or Lost with a reason
- Stage transitions tracked with timestamps and the staff member responsible
- Task assignment and reminders for counsellors and front desk staff
- Duplicate enquiry detection and merge, so the same family is not logged twice

Automated Follow Up

- Templated SMS and email reminders and notices

- Scheduled drip sequences for nurturing a lead over time
- Automatic response sent on receipt of a new enquiry
- Messaging consent capture and unsubscribe handling, per DPDP requirements

Admissions Workflow

- Application intake and document collection
- Admission confirmation step
- On confirmation, the system creates a student stub record: name, date of birth, class or section applied for, board, guardian name and contact, admission date, fee status placeholder, and the originating enquiry ID
- Handoff to a full student profile if the Smart ERP module is present in future, otherwise the stub remains the record EduWand holds

Data Handoff to Incumbent ERP

- CSV export of admitted students back to the school's existing ERP
- User-definable column mapping, saved as a reusable export profile per school
- Export runnable on demand or on a schedule, with a full export log
- This is what allows the module to be sold and used standalone, without replacing the school's current system

Analytics

- Enquiry volume by source
- Conversion funnel and conversion rate
- Year on year enrolment growth tracking
- Counsellor performance view

Access and Security

- Role based access control
- Operates fully with only core platform foundations present, no dependency on any other module

2.2 How It Is Used, Day to Day

- Front desk staff log a new enquiry within about 30 seconds of a call or walk-in, capturing source and interest immediately
- Counsellors are reminded to follow up and can send templated SMS notices with one action
- Leadership views the enquiry to admission funnel and conversion rate live, and tracks enrolment growth year on year
- Duplicate enquiries for the same family are flagged automatically and merged by a counsellor

2.3 Acceptance Criteria

- An enquiry can be logged in under approximately 30 seconds with all mandatory fields
- Automated follow up messages fire on schedule and are logged against the enquiry record

- Funnel and conversion analytics update in near real time
- Duplicate enquiries are detected at the point of entry
- Messaging consent is captured before any automated message is sent to a parent or guardian

3. Module 2, AI Module, Lesson Studio and Assignment Lab

Lets teachers use AI without prompting or switching between apps. Two sub-tools work together: Lesson Studio, for creating lesson plans, learning material, and research reports, and Assignment Lab, for creating and grading personalised assignments with live analytics for the teacher. Both run on Gemini 2.5 Flash as the underlying AI provider.

3.1 Full Feature List

Lesson Studio

- Lesson plan generation, for example in CBSE-mandated 5E format
- Content and research report generation from a topic or curriculum reference
- Board aware generation, adapting to CBSE, ICSE, or State board curriculum
- Outputs auto-saved to the classroom database, with no separate upload step

Assignment Lab

- Personalised assignment generation, suggesting a difficulty mix per student based on recent performance
 - Built with the teacher-initiated fallback design: the teacher reviews and approves the suggested mix before it is applied, rather than the system acting on a student automatically
 - Per-student opt out available, and recorded
- AI grading of submissions, with feedback and suggested next steps for each student
- Teacher override available on every AI-assigned grade
- Flags submissions that may need closer attention, cases that can otherwise go unnoticed in a large class

Analytics

- Live per-student performance view, always available to the teacher
- Live per-class performance view
- Basic AI usage analytics surfaced to the Admin Dashboard: generations per teacher, grading turnaround

Platform

- Operates on web and on teacher tablets
- Built on Gemini 2.5 Flash, Google's price to performance AI model, hosted on Google Cloud, India region

3.2 How It Is Used, Day to Day

- A teacher generates custom learning material for a topic in a matter of minutes
- A teacher creates a class assignment that personalises a share of questions per student, after reviewing and approving the suggested mix

- A teacher has assignments AI-graded with feedback, and sees at a glance which students need help

3.3 Acceptance Criteria

- A lesson plan is generated in under approximately 60 seconds
- Personalisation is applied only after teacher approval, to the agreed share of assignment items
- AI grading is validated against a teacher-graded sample within an agreed accuracy tolerance
- Analytics update in near real time after a submission is graded
- All generated content is stored and retrievable for the full academic year

3.4 Safeguards Built Into This Module

FR-AI-2, personalising assignments from a student's performance history, is treated with particular care in this build. Automated behavioural profiling of a child raises a data privacy question under India's DPDP Act. Rather than waiting on a legal ruling, this module ships with the safer design agreed for this build:

- Personalisation is teacher-initiated and teacher-visible, not an automated profile acting on a child without review
- No persistent behavioural profile is created or acted on without a teacher's active decision at the point of use
- Per-student opt out is available and recorded

This keeps the feature genuinely useful for teachers while staying outside the automated profiling concern raised against this feature in the product requirements.

4. Feature Count Summary

Module	Feature Areas	Individual Features Listed
Enrolment Growth Engine	6, Enquiry Capture, Admissions Pipeline, Automated Follow Up, Admissions Workflow, Data Handoff, Analytics	24
AI Module, Lesson Studio and Assignment Lab	4, Lesson Studio, Assignment Lab, Analytics, Platform	15

Both modules run inside the Unified App, under the relevant role. Enrolment Growth Engine features are used primarily by front desk and admissions staff, with the analytics view also visible to leadership in the Admin Dashboard. AI Module features are used by teachers, with usage analytics also visible to leadership in the Admin Dashboard.
